Vorlesung Künstliche Intelligenz Wintersemester 2008/09

# Teil III: Wissensrepräsentation und Inferenz

Kap. 10: Beschreibungslogiken

# Beschreibungslogiken (Description Logics)

#### Beschreibungslogiken

- sind eine Familie von logik-basierten Wissensrepräsentationssprachen
- stammen von semantischen Netzen und KL-ONE ab.
- beschreiben die Welt mit Konzepten (Klassen), Rollen (Relationen) und Individuen.
- haben eine formale (typischerweise modell-theoretische) Semantik.
  - Sie sind entscheidbare Fragmente der PL1
  - und eng verwandt mit aussagenlogischen Modal- und Temporallogiken.
- bieten Inferenzmechanismen für zentrale Probleme.
  - Korrekte und vollständige Entscheidungsverfahren existieren.
  - Hoch-effiziente Implementierungen existieren.
- Einfache Sprache zum Start:  $\mathcal{ALC}$  (Attributive Language with Complement)
- Im Semantic Web wird  $SHOIN(D_n)$  eingesetzt. Hierauf basiert die Semantik von OWL DL.

#### Geschichte

- Ihre Entwicklung wurde inspiriert durch semantische Netze und Frames.
- **■** Frühere Namen:
  - KL-ONE like languages
  - terminological logics
- Ziel war eine Wissensrepräsentation mit formaler Semantik.
- Das erste Beschreibungslogik-basierte System war KL-ONE (1985).
- Weitere Systeme u.a. LOOM (1987), BACK (1988), KRIS (1991), CLASSIC (1991), FaCT (1998), RACER (2001), KAON 2 (2005).

#### What is the Problem?

# Consider a typical web page:

#### Markup consists of:

- rendering information (e.g., font size and colour)
- Hyper-links to related content

Semantic content is accessible to humans but not (easily) to computers...

#### What information can we see...

#### WWW2002

The eleventh international world wide web conference

Sheraton waikiki hotel

Honolulu, hawaii, USA

7-11 may 2002

1 location 5 days learn interact

Registered participants coming from

australia, canada, chile denmark, france, germany, ghana, hong kong, india, ireland, italy, japan, malta, new zealand, the netherlands, norway, singapore, switzerland, the united kingdom, the united states, vietnam, zaire

#### Register now

On the 7<sup>th</sup> May Honolulu will provide the backdrop of the eleventh international world wide web conference. This prestigious event ...

Speakers confirmed

#### **Recall: Logics and Model Theory**

Ontology/KR languages aim to model (part of) world

Terms in language correspond to entities in world

#### Meaning given by, e.g.:

- Mapping to another formalism, such as FOL, with own well defined semantics
- or a Model Theory (MT)

#### MT defines relationship between syntax and *interpretations*

- There can be many interpretations (models) of one piece of syntax
- Models supposed to be analogue of (part of) world
  - E.g., elements of model correspond to objects in world
- Formal relationship between syntax and models
  - Structure of models reflect relationships specified in syntax
- Inference (e.g., subsumption) defined in terms of MT
  - E.g.,  $\mathcal{T} \models A \sqsubseteq B$  iff in every model of  $\mathcal{T}$ , ext(A)  $\subseteq$  ext(B)

#### **Recall: Logics and Model Theory**

Many logics (including standard First Order Logic) use a model theory based on (Zermelo-Frankel) set theory

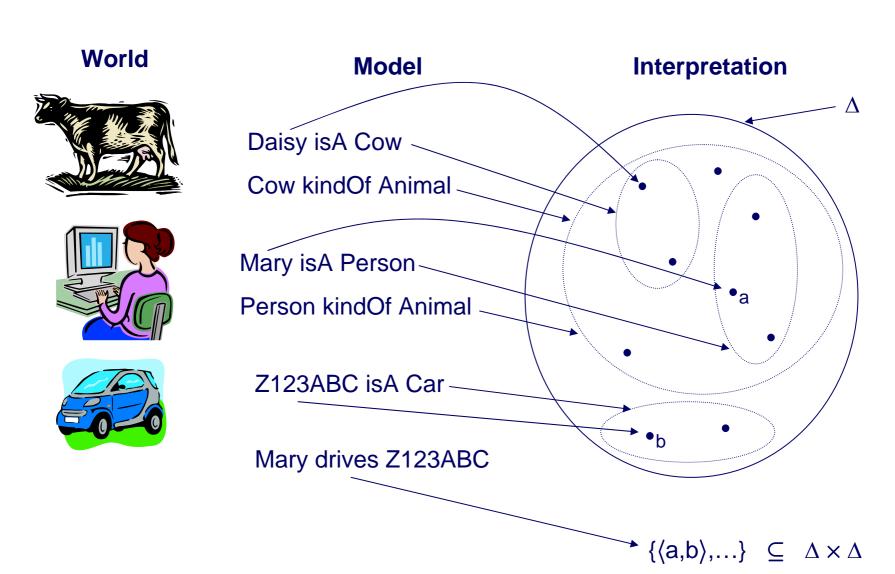

The domain of discourse (i.e., the part of the world being modelled) is represented as a set (often referred as  $\Delta$ )

Objects in the world are interpreted as elements of  $\Delta$ 

- Classes/concepts (unary predicates) are subsets of  $\Delta$
- Properties/roles (binary predicates) are subsets of  $\Delta \times \Delta$  (i.e.,  $\Delta^2$ )
- Ternary predicates are subsets of  $\Delta^3$  etc.

The sub-class relationship between classes can be interpreted as set inclusion.

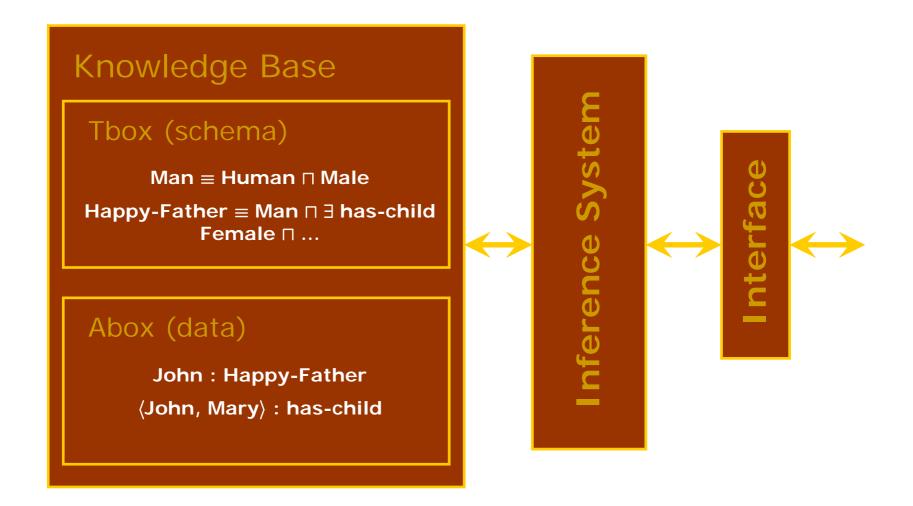

Formally, the vocabulary is the set of names we use in our model of (part of) the world

- {Daisy, Cow, Animal, Mary, Person, Z123ABC, Car, drives, ...} An interpretation  $\mathcal{I}$  is a tuple  $\langle \Delta, \cdot^{\mathcal{I}} \rangle$ 
  - $\blacksquare$   $\triangle$  is the domain (a set)
  - $\blacksquare$   $\cdot^{\mathcal{I}}$  is a mapping that maps
    - Names of objects to elements of Δ
    - Names of unary predicates (classes/concepts) to subsets of Δ
    - Names of binary predicates (properties/roles) to subsets of  $\Delta \times \Delta$
    - And so on for higher arity predicates (if any)

# **DL Knowledge Base**

#### DL Knowledge Base (KB) normally separated into 2 parts:

- TBox is a set of axioms describing structure of domain (i.e., a conceptual schema), e.g.:
  - HappyFather = Man ∧ ∃hasChild.Female ∧ ...
  - Elephant = Animal \( \triangle \) Large \( \triangle \) Grey
  - transitive(ancestor)
- ABox is a set of axioms describing a concrete situation (data), e.g.:
  - John:HappyFather
  - <John,Mary>:hasChild

#### Separation has no logical significance

■ But may be conceptually and implementationally convenient

Interpretation function  $\mathcal{I}$  extends to concept expressions in the obvious way, i.e.:

$$(C \sqcap D)^{\mathcal{I}} = C^{\mathcal{I}} \cap D^{\mathcal{I}}$$

$$(C \sqcup D)^{\mathcal{I}} = C^{\mathcal{I}} \cup D^{\mathcal{I}}$$

$$(\neg C)^{\mathcal{I}} = \Delta^{\mathcal{I}} \setminus C^{\mathcal{I}}$$

$$\{x\}^{\mathcal{I}} = \{x^{\mathcal{I}}\}$$

$$(\exists R.C)^{\mathcal{I}} = \{x \mid \exists y. \langle x, y \rangle \in R^{\mathcal{I}} \land y \in C^{\mathcal{I}}\}$$

$$(\forall R.C)^{\mathcal{I}} = \{x \mid \forall y. (x, y) \in R^{\mathcal{I}} \Rightarrow y \in C^{\mathcal{I}}\}$$

$$(\leqslant nR)^{\mathcal{I}} = \{x \mid \#\{y \mid \langle x, y \rangle \in R^{\mathcal{I}}\} \leqslant n\}$$

$$(\geqslant nR)^{\mathcal{I}} = \{x \mid \#\{y \mid \langle x, y \rangle \in R^{\mathcal{I}}\} \geqslant n\}$$

# **DL Knowledge Bases (Ontologies)**

# A DL Knowledge Base is of the form $\mathcal{K} = \langle \mathcal{T}, \mathcal{A} \rangle$

- $\blacksquare$   $\mathcal{T}$  (Tbox) is a set of axioms of the form:
  - C ⊆ D (concept inclusion)
  - $C \equiv D$  (concept equivalence)
  - $R \sqsubseteq S$  (role inclusion)
  - $R \equiv S$  (role equivalence)
  - $R^+ \subseteq R$  (role transitivity)
- $\blacksquare$  A (Abox) is a set of axioms of the form
  - x ∈ D (concept instantiation)
  - $\langle x,y \rangle \in R$  (role instantiation)

#### Two sorts of Tbox axioms often distinguished

- "Definitions"
  - $C \sqsubseteq D$  or  $C \equiv D$  where C is a concept name
- General Concept Inclusion axioms (GCIs)
  - $C \sqsubseteq D$  where C is an arbitrary concept

# **Knowledge Base Semantics**

An interpretation  $\mathcal{I}$  satisfies (models) an axiom A ( $\mathcal{I} \models A$ ):

- $\blacksquare \quad \mathcal{I} \models \mathcal{C} \sqsubseteq \mathcal{D} \text{ iff } \mathcal{C}^{\mathcal{I}} \subseteq \mathcal{D}^{\mathcal{I}}$
- $\blacksquare$   $\mathcal{I} \models C \equiv D$  iff  $C^{\mathcal{I}} = D^{\mathcal{I}}$
- $\blacksquare$   $\mathcal{I} \models R \sqsubseteq S \text{ iff } R^{\mathcal{I}} \subseteq S^{\mathcal{I}}$
- $\blacksquare \mathcal{I} \models R \equiv S \text{ iff } R^{\mathcal{I}} = S^{\mathcal{I}}$
- $\blacksquare \mathcal{I} \models \mathbf{R}^+ \sqsubseteq \mathbf{R} \text{ iff } (\mathbf{R}^{\mathcal{I}})^+ \subseteq \mathbf{R}^{\mathcal{I}}$
- $\blacksquare$   $\mathcal{I} \models x \in D$  iff  $x^{\mathcal{I}} \in D^{\mathcal{I}}$
- $\blacksquare \quad \mathcal{I} \vDash \langle \mathbf{x}, \mathbf{y} \rangle \in \mathbf{R} \text{ iff } (\mathbf{x}^{\mathcal{I}}, \mathbf{y}^{\mathcal{I}}) \in \mathbf{R}^{\mathcal{I}}$

 $\mathcal{I}$  satisfies a Tbox  $\mathcal{T}$  ( $\mathcal{I} \models \mathcal{T}$ ) iff  $\mathcal{I}$  satisfies every axiom A in  $\mathcal{T}$ 

 $\mathcal{I}$  satisfies an Abox  $\mathcal{A}$  ( $\mathcal{I} \models \mathcal{A}$ ) iff  $\mathcal{I}$  satisfies every axiom A in  $\mathcal{A}$ 

 $\mathcal{I}$  satisfies an KB  $\mathcal{K}$  ( $\mathcal{I} \models \mathcal{K}$ ) iff  $\mathcal{I}$  satisfies both  $\mathcal{T}$  and  $\mathcal{A}$ 

#### Inference Tasks

#### Knowledge is correct (captures intuitions)

 $\blacksquare$  C subsumes D w.r.t.  $\mathcal{K}$  iff for every model  $\mathcal{I}$  of  $\mathcal{K}$ ,  $C^{\mathcal{I}} \subseteq D^{\mathcal{I}}$ 

#### Knowledge is minimally redundant (no unintended synonyms)

■ C is equivalent to D w.r.t.  $\mathcal{K}$  iff for every model  $\mathcal{I}$  of  $\mathcal{K}$ ,  $C^{\mathcal{I}} = D^{\mathcal{I}}$ 

#### Knowledge is meaningful (classes can have instances)

 $\blacksquare$  C is satisfiable w.r.t.  $\mathcal{K}$  iff there exists some model  $\mathcal{I}$  of  $\mathcal{K}$  s.t.  $C^{\mathcal{I}} \neq \emptyset$ 

#### Querying knowledge

- $\blacksquare$  x is an instance of C w.r.t.  $\mathcal{K}$  iff for every model  $\mathcal{I}$  of  $\mathcal{K}$ ,  $x^{\mathcal{I}} \in C^{\mathcal{I}}$
- $\blacksquare$   $\langle x,y \rangle$  is an instance of R w.r.t.  $\mathcal{K}$  iff for, every model  $\mathcal{I}$  of  $\mathcal{K}$ ,  $(x^{\mathcal{I}},y^{\mathcal{I}}) \in R^{\mathcal{I}}$

#### Knowledge base consistency

 $\blacksquare$  A KB  $\mathcal{K}$  is consistent iff there exists *some* model  $\mathcal{I}$  of  $\mathcal{K}$

# The Description Logic ALC: Syntax

Atomic types: concept names 
$$A, B, \ldots$$
 (unary predicates) role names  $R, S, \ldots$  (binary predicates)

Constructors: 
$$\neg C$$
 (negation)

- 
$$C \sqcap D$$
 (conjunction)

- 
$$C \sqcup D$$
 (disjunction)

- 
$$\exists R.C$$
 (existential restriction)

- 
$$\forall R.C$$
 (value restriction)

Abbreviations: - 
$$C o D = \neg C \sqcup D$$
 (implication)

- 
$$C \leftrightarrow D = C \rightarrow D$$
 (bi-implication)

$$- \top = (A \sqcup \neg A)$$
 (top concept)

$$- \perp = A \sqcap \neg A \qquad \text{(bottom concept)}$$

U resden

O

# **Examples**

Person □ Female

Person □ ∃attends.Course

• Person  $\sqcap$   $\forall$ attends.(Course  $\rightarrow \neg$ Easy)

Person □ ∃teaches.(Course □ ∀attended-by.(Bored □ Sleeping))

#### **Interpretations**

Semantics based on interpretations  $(\Delta^{\mathcal{I}}, \cdot^{\mathcal{I}})$ , where

- $-\Delta^{\mathcal{I}}$  is a non-empty set (the domain)
- $-\cdot^{\mathcal{I}}$  is the interpretation function mapping each concept name A to a subset  $A^{\mathcal{I}}$  of  $\Delta^{\mathcal{I}}$  and each role name R to a binary relation  $R^{\mathcal{I}}$  over  $\Delta^{\mathcal{I}}$ .

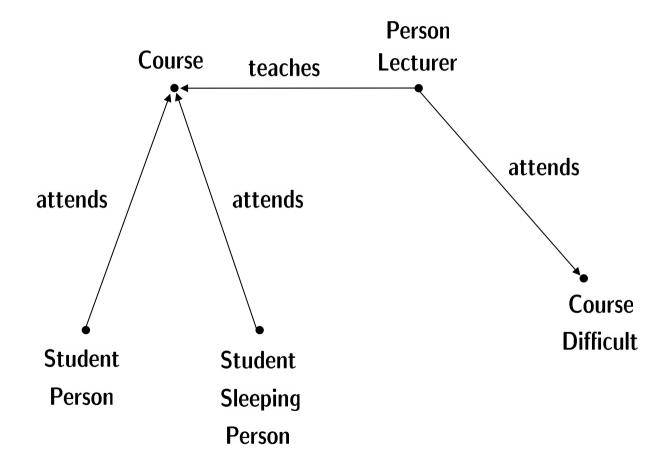

Intuition: interpretation is complete description of the world

Technically: interpretation is first-order structure with only unary and binary predicates

Ö

# **Example**

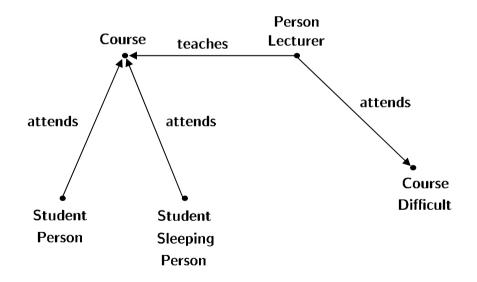

U resden

9

#### **Semantics of Complex Concepts**

$$(\neg C)^{\mathcal{I}} = \Delta^{\mathcal{I}} \setminus C^{\mathcal{I}} \qquad (C \sqcap D)^{\mathcal{I}} = C^{\mathcal{I}} \cap D^{\mathcal{I}} \qquad (C \sqcup D)^{\mathcal{I}} = C^{\mathcal{I}} \cup D^{\mathcal{I}}$$
 
$$(\exists R.C)^{\mathcal{I}} = \{d \mid \text{ there is an } e \in \Delta^{\mathcal{I}} \text{ with } (d,e) \in R^{\mathcal{I}} \text{ and } e \in C^{\mathcal{I}}\}$$
 
$$(\forall R.C)^{\mathcal{I}} = \{d \mid \text{ for all } e \in \Delta^{\mathcal{I}}, (d,e) \in R^{\mathcal{I}} \text{ implies } e \in C^{\mathcal{I}}\}$$

Person  $\square$   $\exists$ attends.Course

Person  $\sqcap \forall$ attends.( $\neg$ Course  $\sqcup$  Difficult)

resden

#### **TBoxes**

Capture an application's terminology means defining concepts

TBoxes are used to store concept definitions:

#### Syntax:

finite set of concept equations  $A \doteq C$ 

with A concept name and C concept

left-hand sides must be unique!

#### **Semantics:**

interpretation  $\mathcal I$  satisfies  $A \doteq C$  iff  $A^{\mathcal I} = C^{\mathcal I}$ 

 $\mathcal{I}$  is model of  $\mathcal{T}$  if it satisfies all definitions in  $\mathcal{T}$ 

**E.g.**: Lecturer  $\doteq$  Person  $\sqcap$   $\exists$ teaches.Course

Yields two kinds of concept names: defined and primitive

resden

#### **TBox: Example**

# TBoxes are used as ontologies:

Woman **≐** Person □ Female

Man **≐** Person □ ¬Woman

Lecturer  $\doteq$  Person  $\sqcap$   $\exists$ teaches.Course

Student  $\doteq$  Person  $\sqcap$   $\exists$ attends.Course

 $BadLecturer \doteq Person \sqcap \forall teaches.(Course \rightarrow Boring)$ 

# TBox: Example II

A TBox restricts the set of admissible interpretations.

**Lecturer ≐ Person** □ ∃**teaches.Course** 

Student  $\doteq$  Person  $\sqcap$   $\exists$ attends.Course

り U resden

### **Reasoning Tasks** — **Subsumption**

$$C$$
 subsumed by  $D$  w.r.t.  $\mathcal{T}$  (written  $C \sqsubseteq_{\mathcal{T}} D$ )

iff

$$C^{\mathcal{I}} \subseteq D^{\mathcal{I}}$$
 holds for all models  ${\mathcal{I}}$  of  ${\mathcal{T}}$ 

Intuition: If  $C \sqsubseteq_{\mathcal{T}} D$ , then D is more general than C

# Example:

Lecturer  $\doteq$  Person  $\sqcap$   $\exists$ teaches.Course

Student  $\doteq$  Person  $\sqcap$   $\exists$ attends.Course

Then

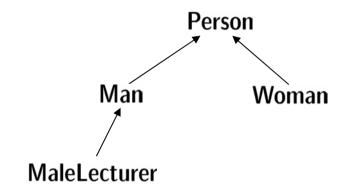

Lecturer  $\sqcap \exists$  attends.Course  $\sqsubseteq_{\mathcal{T}}$  Student

# Reasoning Tasks — Classification

Classification: arrange all defined concepts from a TBox in a hierarchy w.r.t. generality

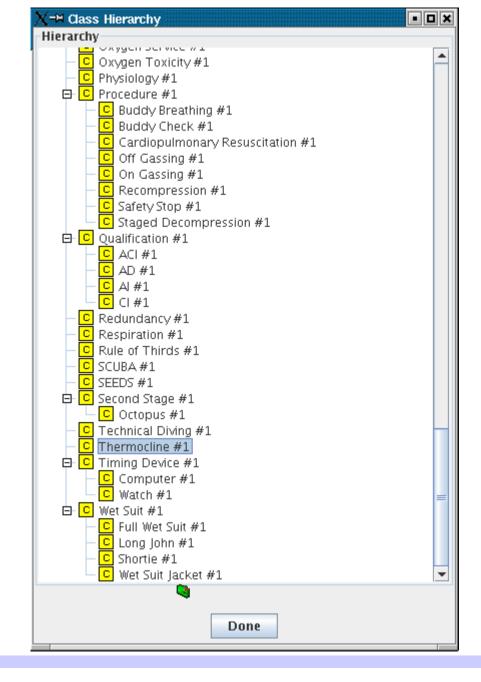

Man **≐** Person □ ¬Woman

MaleLecturer  $\doteq$  Man  $\sqcap$   $\exists$ teaches.Course

Can be computed using multiple subsumption tests

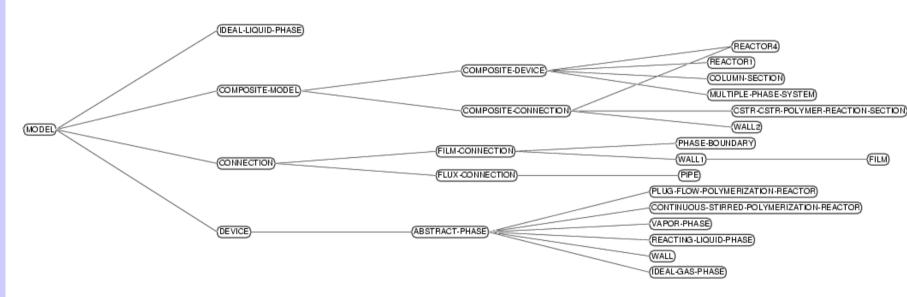

Provides a principled view on ontology for browsing, maintaining, etc.

resden

# A Concept Hierarchy

# **Excerpt from a process engineering ontology**

#### Reasoning Tasks — Satisfiability

C is satisfiable w.r.t.  $\mathcal{T}$  iff  $\mathcal{T}$  has a model with  $C^{\mathcal{I}} 
eq \emptyset$ 

**Intuition:** If unsatisfiable, the concept contains a contradiction.

**Example:** Woman  $\doteq$  Person  $\sqcap$  Female

Man **≐** Person □ ¬Woman

Then  $\exists$ sibling.Man  $\sqcap \forall$ sibling.Woman is unsatisfiable w.r.t.  $\mathcal{T}$ 

Subsumption can be reduced to (un)satisfiability and vice versa:

- $C \sqsubseteq_{\mathcal{T}} D$  iff  $C \sqcap \neg D$  is not satisfiable w.r.t.  $\mathcal{T}$
- C is satisfiable w.r.t.  $\mathcal{T}$  if not  $C \sqsubseteq_{\mathcal{T}} \bot$ .

Many reasoners decide satisfiability rather than subsumption.

#### **Definitorial TBoxes**

A primitive interpretation for TBox  $\mathcal{T}$  interpretes

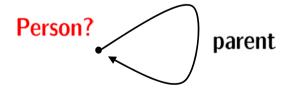

- the primitive concept names in  $\mathcal{T}$
- all role names

A TBox is called definitorial if every primitive interpretation for  $\mathcal{T}$  can be uniquely extended to a model of  $\mathcal{T}$ .

i.e.: primitive concepts (and roles) uniquely determine defined concepts

Not all TBoxes are definitorial:

Person 
$$\doteq \exists parent.Person$$

Non-definitorial TBoxes describe constraints, e.g. from background knowledge

U resden

# **Acyclic TBoxes**

**TBox**  $\mathcal{T}$  is acyclic if there are no definitorial cycles:

#### **Expansion of acyclic TBox** $\mathcal{T}$ :

exhaustively replace defined concept names with their definition (terminates due to acyclicity)

Acyclic TBoxes are always definitorial:

first expand, then set 
$$A^{\mathcal{I}} := C^{\mathcal{I}}$$
 for all  $A \doteq C \in \mathcal{T}$ 

#### Acyclic TBoxes II

For reasoning, acyclic TBox can be eliminated:

- to decide  $C \sqsubseteq_{\mathcal{T}} D$  with  $\mathcal{T}$  acyclic,
  - expand  ${\mathcal T}$
  - replace defined concept names in C, D with their definition
  - decide  $C \sqsubseteq D$
- analogously for satisfiability

May yield an exponential blow-up:

$$egin{aligned} A_0 &\doteq orall r.A_1 \sqcap orall s.A_1 \ A_1 &\doteq orall r.A_2 \sqcap orall s.A_2 \end{aligned}$$

$$A_{n-1} \doteq \forall r.A_n \sqcap \forall s.A_n$$

U resden

#### **General Concept Inclusions**

View of TBox as set of constraints

General TBox: finite set of general concept implications (GCIs)

$$C \sqsubseteq D$$

with both C and D allowed to be complex

e.g. Course □ ∀attended-by.Sleeping ⊑ Boring

Interpretation  $\mathcal{I}$  is model of general TBox  $\mathcal{T}$  if

$$C^{\mathcal{I}} \subseteq D^{\mathcal{I}}$$
 for all  $C \sqsubseteq D \in \mathcal{T}$ .

 $C \doteq D$  is abbreviation for  $C \sqsubseteq D$ ,  $D \sqsubseteq C$ 

e.g. Student  $\sqcap \exists$  has-favourite. Soccer Team  $\doteq$  Student  $\sqcap \exists$  has-favourite. Beer

Note:  $C \sqsubseteq D$  equivalent to  $\top \doteq C o D$ 

#### **ABoxes**

ABoxes describe a snapshot of the world

An ABox is a finite set of assertions

a:C (a individual name, C concept)

 $(a,b):R\quad (a,b ext{ individual names, }R ext{ role name})$ 

E.g. {peter : Student, (dl-course, uli) : tought-by}

Interpretations  $\mathcal{I}$  map each individual name a to an element of  $\Delta^{\mathcal{I}}$ .

 $\mathcal{I}$  satisfies an assertion

a:C iff  $a^{\mathcal{I}}\in C^{\mathcal{I}}$ 

(a,b):R iff  $(a^{\mathcal{I}},b^{\mathcal{I}})\in R^{\mathcal{I}}$ 

 $\mathcal{I}$  is a model for an ABox  $\mathcal{A}$  if  $\mathcal{I}$  satisfies all assertions in  $\mathcal{A}$ .

#### **ABoxes II**

#### Note:

- interpretations describe the state if the world in a complete way
- ABoxes describe the state if the world in an incomplete way

(uli, dl-course): tought-by uli: Female

does not imply

dl-course : ∀tought-by.Female

An ABox has many models!

An ABox constraints the set of admissibile models similar to a TBox

#### Reasoning with ABoxes

#### **ABox consistency**

Given an ABox  $\mathcal{A}$  and a TBox  $\mathcal{T}$ , do they have a common model?

#### **Instance checking**

Given an ABox  $\mathcal{A}$ , a TBox  $\mathcal{T}$ , an individual name a, and a concept C does  $a^{\mathcal{I}} \in C^{\mathcal{I}}$  hold in all models of  $\mathcal{A}$  and  $\mathcal{T}$ ?

(written  $\mathcal{A}, \mathcal{T} \models a : C$ )

The two tasks are interreducible:

- $\mathcal{A}$  consistent w.r.t.  $\mathcal{T}$  iff  $\mathcal{A}, \mathcal{T} \not\models a : \bot$
- $\mathcal{A}, \mathcal{T} \models a : C \text{ iff } \mathcal{A} \cup \{a : \neg C\} \text{ is not consistent }$

U resc

#### **Example for ABox Reasoning**

ABox

dumbo: Mammal

t14 : Trunk

g23: Darkgrey

(dumbo, t14): bodypart

(dumbo, g23) : color

dumbo : ∀color.Lightgrey

**TBox** 

Elephant  $\doteq$  Mammal  $\sqcap$   $\exists$ bodypart.Trunk  $\sqcap$   $\forall$ color.Grey

**Grey ≐ Lightgrey ⊔ Darkgrey** 

⊥ **=** Lightgrey □ Darkgrey

- 1. ABox is inconsistent w.r.t. TBox.
- 2. dumbo is an instance of Elephant

### 2. Tableau algorithms for $\mathcal{ALC}$ and extensions

We see a tableau algorithm for  $\mathcal{ALC}$  and extend it with

- ① general TBoxes and
- 2 inverse roles

**Goal:** Design sound and complete desicion procedures for satisfiability (and subsumption) of DLs which are well-suited for implementation purposes

### A tableau algorithm for the satisfiability of $\mathcal{ALC}$ concepts

Goal: design an algorithm which takes an  $\mathcal{ALC}$  concept  $C_0$  and

- 1. returns "satisfiable" iff  $C_0$  is satisfiable and
- 2. terminates, on every input,
- i.e., which decides satisfiability of  $\mathcal{ALC}$  concepts.

Recall: such an algorithm cannot exist for FOL since satisfiability of FOL is undecidable.

Idea: our algorithm

- is tableau-based and
- ullet tries to construct a model of  $C_0$
- ullet by breaking  $C_0$  down syntactically, thus
- inferring new constraints on such a model.

### **Preliminaries: Negation Normal Form**

To make our life easier, we transform each concept  $C_0$  into an equivalent  $C_1$  in NNF

**Equivalent:**  $C_0 \sqsubseteq C_1$  and  $C_1 \sqsubseteq C_0$ 

NNF: negation occurs only in front of concept names

**How?** By pushing negation inwards (de Morgan et. al):

$$egreent (C \sqcap D) \leadsto \neg C \sqcup \neg D \\
egreent (C \sqcup D) \leadsto \neg C \sqcap \neg D \\
egreent (C \sqcup D) \leadsto \neg C \sqcap \neg D \\
egreent (C \sqcup D) \leadsto \neg C \sqcap \neg D \\
egreent (C \sqcup D) \leadsto \neg C \sqcap \neg D \\
egreent (C \sqcup D) \leadsto \neg C \sqcap \neg C \\

egreent (C \sqcup D) \sqcap \neg C \sqcap \neg C$$

From now on: concepts are in NNF and

 $\mathsf{sub}(C)$  denotes the set of all sub-concepts of C

#### More intuition

Find out whether  $A\sqcap\exists R.B\sqcap\forall R.\lnot B$  is satisfiable...  $A\sqcap\exists R.B\sqcap\forall R.(\lnot B\sqcup\exists S.E)$ 

Our tableau algorithm works on a completion tree which

- ullet represents a model  $\mathcal{I}$ : nodes represent elements of  $\Delta^{\mathcal{I}}$ 
  - ightharpoonup each node x is labelled with concepts  $\mathcal{L}(x) \subseteq \mathsf{sub}(C_0)$   $C \in \mathcal{L}(x)$  is read as "x should be an instance of C"

edges represent role successorship

- ightarrow each edge  $\langle x,y
  angle$  is labelled with a role-name from  $C_0$   $R\in\mathcal{L}(\langle x,y
  angle)$  is read as "(x,y) should be in  $R^\mathcal{I}$ "
- ullet is initialised with a single root node  $x_0$  with  $\mathfrak{L}(x_0)=\{C_0\}$
- is expanded using completion rules

### Completion rules for $\mathcal{ALC}$

T-rule: if  $C_1\sqcap C_2\in \mathfrak{L}(x)$  and  $\{C_1,C_2\}\not\subseteq \mathfrak{L}(x)$  then set  $\mathfrak{L}(x)=\mathfrak{L}(x)\cup \{C_1,C_2\}$ 

 $\sqcup$ -rule: if  $C_1\sqcup C_2\in \mathcal{L}(x)$  and  $\{C_1,C_2\}\cap \mathcal{L}(x)=\emptyset$  then set  $\mathcal{L}(x)=\mathcal{L}(x)\cup \{C\}$  for some  $C\in \{C_1,C_2\}$ 

 $\exists$ -rule: if  $\exists S.C \in \mathcal{L}(x)$  and x has no S-successor y with  $C \in \mathcal{L}(y)$ , then create a new node y with  $\mathcal{L}(\langle x,y \rangle) = \{S\}$  and  $\mathcal{L}(y) = \{C\}$ 

orall-rule: if  $orall S.C \in \mathcal{L}(x)$  and there is an S-successor y of x with  $C 
otin \mathcal{L}(y)$  then set  $\mathcal{L}(y) = \mathcal{L}(y) \cup \{C\}$ 

### Properties of the completion rules for $\mathcal{ALC}$

We only apply rules if their application does "something new"

- rule: if  $C_1 \sqcap C_2 \in \mathcal{L}(x)$  and  $\{C_1,C_2\} \not\subseteq \mathcal{L}(x)$  then set  $\mathcal{L}(x) = \mathcal{L}(x) \cup \{C_1,C_2\}$
- $\sqcup$ -rule: if  $C_1\sqcup C_2\in \mathcal{L}(x)$  and  $\{C_1,C_2\}\cap \mathcal{L}(x)=\emptyset$  then set  $\mathcal{L}(x)=\mathcal{L}(x)\cup \{C\}$  for some  $C\in \{C_1,C_2\}$
- $\exists$ -rule: if  $\exists S.C \in \mathcal{L}(x)$  and x has no S-successor y with  $C \in \mathcal{L}(y)$ , then create a new node y with  $\mathcal{L}(\langle x,y \rangle) = \{S\}$  and  $\mathcal{L}(y) = \{C\}$
- orall-rule: if  $orall S.C \in \mathcal{L}(x)$  and there is an S-successor y of x with  $C \notin \mathcal{L}(y)$  then set  $\mathcal{L}(y) = \mathcal{L}(y) \cup \{C\}$

### Properties of the completion rules for $\mathcal{ALC}$

#### The ⊔-rule is non-deterministic:

 $\sqcap$ -rule: if  $C_1\sqcap C_2\in \mathcal{L}(x)$  and  $\{C_1,C_2\}\not\subseteq \mathcal{L}(x)$  then set  $\mathcal{L}(x)=\mathcal{L}(x)\cup \{C_1,C_2\}$ 

 $\sqcup$ -rule: if  $C_1\sqcup C_2\in \mathcal{L}(x)$  and  $\{C_1,C_2\}\cap \mathcal{L}(x)=\emptyset$  then set  $\mathcal{L}(x)=\mathcal{L}(x)\cup \{C\}$  for some  $C\in \{C_1,C_2\}$ 

 $\exists$ -rule: if  $\exists S.C \in \mathcal{L}(x)$  and x has no S-successor y with  $C \in \mathcal{L}(y)$ , then create a new node y with  $\mathcal{L}(\langle x,y \rangle) = \{S\}$  and  $\mathcal{L}(y) = \{C\}$ 

orall-rule: if  $orall S.C \in \mathcal{L}(x)$  and there is an S-successor y of x with  $C \notin \mathcal{L}(y)$  then set  $\mathcal{L}(y) = \mathcal{L}(y) \cup \{C\}$ 

### Last details on tableau algorithm for $\mathcal{ALC}$

Clash: a c-tree contains a clash if it has a node x with  $\bot \in \mathcal{L}(x)$  or

 $\{A, \neg A\} \subseteq \mathcal{L}(x)$  — otherwise, it is clash-free

Complete: a c-tree is complete if none of the completion rules can be

applied to it

Answer behaviour: when started for  $C_0$  (in NNF!), the tableau algorithm

- ullet is initialised with a single root node  $x_0$  with  $\mathfrak{L}(x_0)=\{C_0\}$
- repeatedly applies the completion rules (in whatever order it likes)
- answer " $C_0$  is satisfiable" iff the completion rules can be applied in such a way that it results in a complete and clash-free c-tree (careful: this is non-deterministic)

...go back to examples

#### Properties of our tableau algorithm

### Lemma: Let $C_0$ an $\mathcal{ALC}$ -concept in NNF. Then

- 1. the algorithm terminates when applied to  $C_0$  and
- 2. the rules can be applied such that they generate a clash-free and complete completion tree iff  $C_0$  is satisfiable.

#### **Corollary:**

- 1. Our tableau algorithm decides satisfiability and subsumption of  $\mathcal{ALC}$ .
- 2. Satisfiability (and subsumption) in ALC is decidable in PSpace.
- 3.  $\mathcal{ALC}$  has the finite model property i.e., every satisfiable concept has a finite model.
- 4.  $\mathcal{ALC}$  has the tree model property i.e., every satisfiable concept has a tree model.
- 5.  $\mathcal{ALC}$  has the finite tree model property i.e., every satisfiable concept has a finite tree model.

### Extend tableau algorithm to $\mathcal{ALC}$ with general TBoxes

#### Recall:

- ullet Concept inclusion: of the form  $C \stackrel{.}{\sqsubseteq} D$  for C, D (complex) concepts
- (General) TBox: a finite set of concept inclusions
- $ullet \, \mathcal{I} \,$  satisfies  $C \stackrel{.}{\sqsubseteq} D \,$  iff  $C^{\mathcal{I}} \subseteq D^{\mathcal{I}} \,$
- ullet  $\mathcal I$  is a model of TBox  $\mathcal T$  iff  $\mathcal I$  satisfies each concept equation in  $\mathcal T$
- ullet  $C_0$  is satisfiable w.r.t.  ${\mathcal T}$  iff there is a model  ${\mathcal I}$  of  ${\mathcal T}$  with  $C_0^{\mathcal I} 
  eq \emptyset$

### Goal – Lemma: Let $C_0$ an $\mathcal{ALC}$ -concept and $\mathcal{T}$ be a an $\mathcal{ALC}$ -TBox. Then

- 1. the algorithm terminates when applied to  ${\mathcal T}$  and  $C_0$  and
- 2. the rules can be applied such that they generate a clash-free and complete completion tree iff  $C_0$  is satisfiable w.r.t.  $\mathcal{T}$ .

### Extend tableau algorithm to $\mathcal{ALC}$ with general TBoxes: Preliminaries

We extend our tableau algorithm by adding a new completion rule:

- ullet remember that nodes represent elements of  $\Delta^{\mathcal{I}}$  and
- ullet if  $C \stackrel{.}{\sqsubseteq} D \in \mathcal{T}$ , then for each element x in a model  $\mathcal{I}$  of  $\mathcal{T}$  if  $x \in C^{\mathcal{I}}$ , then  $x \in D^{\mathcal{I}}$

hence 
$$x \in (\neg C)^{\mathcal{I}}$$
 or  $x \in D^{\mathcal{I}}$   $x \in (\neg C \sqcup D)^{\mathcal{I}}$ 

 $x \in (\mathsf{NNF}(\neg C \sqcup D))^{\mathcal{I}}$ 

for  $\mathsf{NNF}(E)$  the negation normal form of E

#### Completion rules for ALC with TBoxes

T-rule: if  $C_1\sqcap C_2\in\mathcal{L}(x)$  and  $\{C_1,C_2\}\not\subseteq\mathcal{L}(x)$  then set  $\mathcal{L}(x)=\mathcal{L}(x)\cup\{C_1,C_2\}$ 

 $\sqcup$ -rule: if  $C_1 \sqcup C_2 \in \mathcal{L}(x)$  and  $\{C_1,C_2\} \cap \mathcal{L}(x) = \emptyset$  then set  $\mathcal{L}(x) = \mathcal{L}(x) \cup \{C\}$  for some  $C \in \{C_1,C_2\}$ 

 $\exists$ -rule: if  $\exists S.C \in \mathcal{L}(x)$  and x has no S-successor y with  $C \in \mathcal{L}(y)$ , then create a new node y with  $\mathcal{L}(\langle x,y \rangle) = \{S\}$  and  $\mathcal{L}(y) = \{C\}$ 

orall - F-rule: if  $\forall S.C \in \mathcal{L}(x)$  and there is an S-successor y of x with  $C \notin \mathcal{L}(y)$  then set  $\mathcal{L}(y) = \mathcal{L}(y) \cup \{C\}$ 

 ${\mathcal T}$ -rule: if  $C_1 \stackrel{.}{\sqsubseteq} C_2 \in {\mathcal T}$  and  $\mathsf{NNF}(\lnot C_1 \sqcup C_2) \not\in {\mathcal L}(x)$  then set  ${\mathcal L}(x) = {\mathcal L}(x) \cup \{\mathsf{NNF}(\lnot C_1 \sqcup C_2)\}$ 

### A tableau algorithm for $\mathcal{ALC}$ with general TBoxes

Example: Consider satisfiability of C w.r.t.  $\{C \sqsubseteq \exists R.C\}$ 

Tableau algorithm no longer terminates!

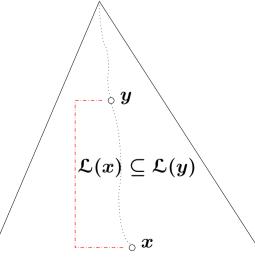

Reason: size of concepts no longer decreases along paths in a completion tree

Observation: most nodes on this path look the same and

we keep repeating ourselves

Regain termination with a "cycle-detection" technique called blocking

Intuitively, whenever we find a situation where y has to satisfy stronger constraints than x, we freeze x, i.e., block rules from being applied to x

### A tableau algorithm for $\mathcal{ALC}$ with general TBoxes: Blocking

- ullet x is directly blocked if it has an ancestor y with  $\mathcal{L}(x)\subseteq\mathcal{L}(y)$
- ullet in this case and if y is the "closest" such node to x, we say that x is blocked by y
- a node is **blocked** if it is directly blocked or one of its ancestors is blocked
- ⊕ restrict the application of all rules to nodes which are not blocked
  - $\rightsquigarrow$  completion rules for  $\mathcal{ALC}$  w.r.t. TBoxes

### A tableau algorithm for $\mathcal{ALC}$ with general TBoxes

```
\sqcap-rule: if C_1\sqcap C_2\in \mathcal{L}(x), \{C_1,C_2\}\not\subseteq \mathcal{L}(x), and x is not blocked then set \mathcal{L}(x)=\mathcal{L}(x)\cup \{C_1,C_2\}
```

 $\sqcup$ -rule: if  $C_1\sqcup C_2\in \mathcal{L}(x)$ ,  $\{C_1,C_2\}\cap \mathcal{L}(x)=\emptyset$ , and x is not blocked then set  $\mathcal{L}(x)=\mathcal{L}(x)\cup \{C\}$  for some  $C\in \{C_1,C_2\}$ 

 $\exists$ -rule: if  $\exists S.C \in \mathcal{L}(x)$ , x has no S-successor y with  $C \in \mathcal{L}(y)$ , and x is not blocked then create a new node y with  $\mathcal{L}(\langle x,y \rangle) = \{S\}$  and  $\mathcal{L}(y) = \{C\}$ 

 $orall ext{-rule:} \quad ext{if} \quad orall S.C \in \mathcal{L}(x) ext{, there is an } S ext{-successor } y ext{ of } x ext{ with } C \notin \mathcal{L}(y)$  and  $x ext{ is not blocked}$  then set  $\mathcal{L}(y) = \mathcal{L}(y) \cup \{C\}$ 

 $\mathcal{T}$ -rule: if  $C_1 \stackrel{.}{\sqsubseteq} C_2 \in \mathcal{T}$ ,  $\mathsf{NNF}(\neg C_1 \sqcup C_2) \not\in \mathcal{L}(x)$  and x is not blocked then set  $\mathcal{L}(x) = \mathcal{L}(x) \cup \{\mathsf{NNF}(\neg C_1 \sqcup C_2)\}$ 

### Tableaux Rules for $\mathcal{ALC}$

$x \bullet \{C_1 \sqcap C_2, \ldots\}$	$\rightarrow_{\sqcap}$	$x \bullet \{C_1 \sqcap C_2, C_1, C_2, \ldots\}$
$x \bullet \{C_1 \sqcup C_2, \ldots\}$	$\rightarrow_{\sqcup}$	$x \bullet \{C_1 \sqcup C_2, \textcolor{red}{C}, \ldots\}$ for $C \in \{C_1, C_2\}$
$x \bullet \{\exists R.C, \ldots\}$	→∃	$x \bullet \{\exists R.C, \ldots\}$ $R \mid Y \bullet \{C\}$
$x \bullet \{ \forall R.C, \ldots \}$ $R \mid $ $y \bullet \{ \ldots \}$	$\longrightarrow \forall$	$x \bullet \{ \forall R.C, \ldots \}$ $R \mid Y \bullet \{C, \ldots \}$

### **Tableaux Rule for Transitive Roles**

Where R is a transitive role (i.e.,  $(R^{\mathcal{I}})^+ = R^{\mathcal{I}}$ )

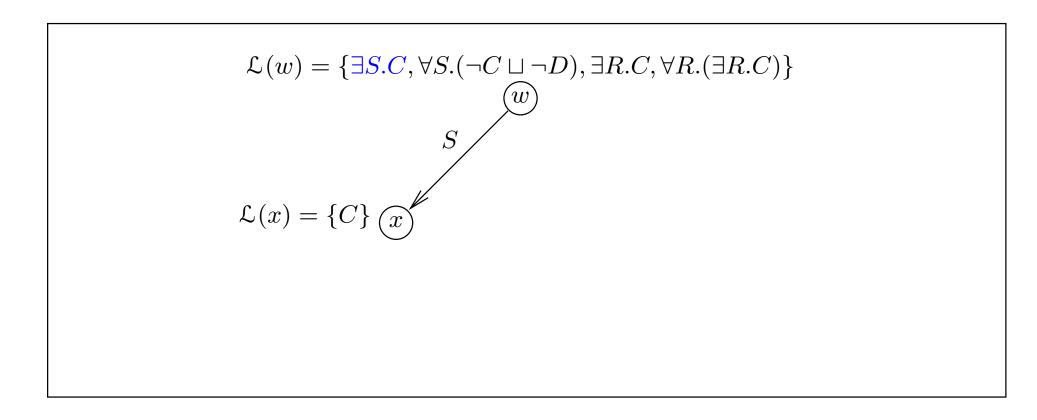

- ightharpoonup No longer naturally terminating (e.g., if  $C = \exists R. \top$ )
- Need blocking
  - Simple blocking suffices for ALC plus transitive roles
  - I.e., do not expand node label if ancestor has superset label
  - More expressive logics (e.g., with inverse roles) need more sophisticated blocking strategies

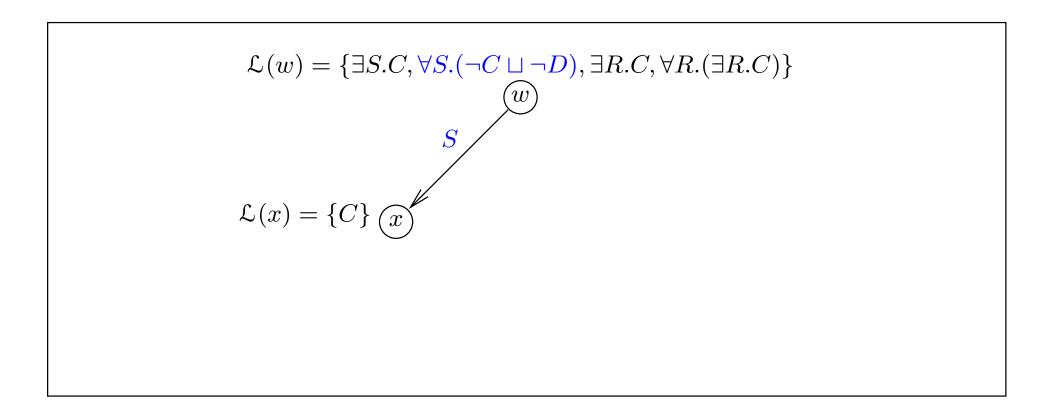

$$\mathcal{L}(w) = \{\exists S.C \sqcap \forall S.(\neg C \sqcup \neg D) \sqcap \exists R.C \sqcap \forall R.(\exists R.C)\}$$

$$\mathcal{L}(w) = \{\exists S.C \sqcap \forall S.(\neg C \sqcup \neg D) \sqcap \exists R.C \sqcap \forall R.(\exists R.C)\}$$

Test satisfiability of  $\exists S.C \sqcap \forall S.(\neg C \sqcup \neg D) \sqcap \exists R.C \sqcap \forall R.(\exists R.C)\}$  where R is a **transitive** role

Concept is **satisfiable**: T corresponds to **model** 

Test satisfiability of  $\exists S.C \sqcap \forall S.(\neg C \sqcup \neg D) \sqcap \exists R.C \sqcap \forall R.(\exists R.C)\}$  where R is a **transitive** role

Concept is **satisfiable**: T corresponds to **model** 

### Properties of our tableau algorithm for $\mathcal{ALC}$ with TBoxes

### **Lemma:** Let $\mathcal T$ be a general $\mathcal{ALC}$ -Tbox and $C_0$ an $\mathcal{ALC}$ -concept. Then

- 1. the algorithm terminates when applied to  ${\mathcal T}$  and  $C_0$  and
- 2. the rules can be applied such that they generate a clash-free and complete completion tree iff  $C_0$  is satisfiable w.r.t.  $\mathcal{T}$ .

#### **Corollary:**

- 1. Satisfiability of  $\mathcal{ALC}$ -concept w.r.t. TBoxes is decidable
- 2. ALC with TBoxes has the finite model property
- 3.  $\mathcal{ALC}$  with TBoxes has the tree model property

#### A tableau algorithm for $\mathcal{ALC}$ with general TBoxes: Summary

#### The tableau algorithm presented here

- $\rightarrow$  decides satisfiability of  $\mathcal{ALC}$ -concepts w.r.t. TBoxes, and thus also
- $\rightarrow$  decides subsumption of  $\mathcal{ALC}$ -concepts w.r.t. TBoxes
- **→** uses **blocking** to ensure termination, and
- $\rightarrow$  is non-deterministic due to the  $\rightarrow$  $\sqcup$ -rule
- → in the worst case, it builds a tree of depth exponential in the size of the input, and thus of double exponential size. Hence it runs in (worst case) 2NExpTime,
- → can be implemented in various ways,
  - order/priorities of rules
  - data structure
  - etc.
- → is amenable to optimisations more on this next week

### **Challenges**

### Increased expressive power

- Existing DL systems implement (at most) SHIQ
- OWL extends SHIQ with datatypes and nominals

### Scalability

- Very large KBs
- Reasoning with (very large numbers of) individuals

### Other reasoning tasks

- Querying
- Matching
- Least common subsumer
- ...

#### Tools and Infrastructure

Support for large scale ontological engineering and deployment

### **Summary**

- Description Logics are family of logical KR formalisms
- Applications of DLs include DataBases and Semantic Web
  - Ontologies will provide vocabulary for semantic markup
  - OWL web ontology language based on SHIQ DL
  - Set to become W3C standard (OWL) & already widely adopted
  - Use of DL provides formal foundations and reasoning support
- DL Reasoning based on tableau algorithms
- Highly Optimised implementations used in DL systems
- Challenges remain
  - Reasoning with full OWL language
  - (Convincing) demonstration(s) of scalability
  - New reasoning tasks
  - Development of (high quality) tools and infrastructure
